```
reducing infection by human rhinovirus (HRV) and hence the initiation or spread of the common cold by HRV. The immunoadhesin binds to HRV and reduces its infectivity, competing with cell surface ICAM-1 for binding sites, interfering with virus entry or uncoating and directing premature release of viral RNA and formation of empty capsids. Expression of the immunoadhesin in plants would be tetrameric, rather than dimeric. Immunoadhesin having multiple binding sites have a higher effective affinity for the virus, thereby increasing the effectiveness of the immunoadhesin. Association of secretory component and immunoglobulin J chain increases the stability of the immunoadhesin in the mucosal environment. Production is significantly less expensive in plants than in animal cell culture and production in plants is safer for human use, since plants are not known to harbor any animal viruses. The present sequence is that of a human immunoglobulin protein sequence, useful to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (a) a chimeric intercellular adhesion molecule (ICAM)-1 comprising: rithinovirus receptor protein linked to at least a portion of immunoglobulin heavy chain; and (b) optionally a Take of the protein continuation of the protein continuation of the protein and (c) optionally a Take of the protein continuation o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      glycosylation and virucide activity. The immunoadhesin is useful for reducing infection by human rhinovirus (HRV) and hence the initiation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunoglobulin heavy chain; and (b) optionally a J chain and secretory component associated with chimeric ICAM-1 molecule. The immunoadhesin has plant-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Fig 7; 138pp;

                                                                                                                                                                                                                                                                                                                                               DNA encoding IgE H-chain and frags. is claimed (AAN40062). Transformant conto. the DNA is also new, esp. Escherichia coli IFO-14284, -5 and -6. The transformant may be grown to produce a polypeptide of immunological or biological activity equivalent to that of the human IgE H chain. AAN40062 or frags. is pref. linked at site downstream from a promoter, e.g. rec A promoter (see AAN40064)

                                                                                                                                                                                                                             δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E [IgB] in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic crhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain CI-C2-C3-C4 domains fused to the MIGIS of fragment used to create the epitopes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Catalytic antibodies which cleave specific target sequences in the IgE heavy chain constant region are exemplified. Cleavage is targetted so as to separate the Fab (antigen binding region) from the Fc region (contg. FcR binding site for attachment to the IgE receptor on mast cells), thereby destroying receptor binding activity. The target peptides were selected after consideration of their primary and secondary structure. The antibodies can be used to block
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Selecting catalytic antibodies which cleave target peptide - to block allergic reactions or as preventive treatment

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ş
                 This invention relates to a novel method for inducing an immune resagainst autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphc (CTL) epitope and/or B-cell epitope derived from IgE, and T helper epitope (TH epitope) which is foreign to the animal, by antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      rgk; allergy; human; antiallergic; immunosuppressive; antianaphylactic;

The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains used to create the epitopes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention relates to a novel method for inducing an immune response capainst autologous immunoglobulin E [Ig] in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell cepitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCS) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in the animal. This method is useful in the prevention and treatment of allergic diseases such as anaphylaxis, allergic crhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in a manmalian system, this sequence was used to create the epitopes of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel method for inducing an immune response against autologous immunoglobulin E (IgE) in an animal. The method comprises effecting simultaneous presentation of cytotoxic T lymphocyte (CTL) epitope and/or B-cell epitope derived from IgE, and T helper cell epitope (TH epitope) which is foreign to the animal, by antigen presenting cells (APCs) of the animal's immune system. The epitopes of the invention may be used as a vaccine against allergic diseases. The method of the invention is useful for inducing an immune response against autologous IgE in an animal, which is useful for downregulating autologous IgE in an animal, which is useful for downregulating and treatment of allergic diseases such as anaphylaxis, allergic rhinitis, asthma and atopic dermatitis. The present sequence represents the human IgE heavy chain C2-C3-C4 domains optimised for expression in an E. Coli system, this sequence was used to create the epitopes of the

The DNA sequence was isolated from a human myeloma (266BL cDNA llbrary screened with a probe corresp. to the N-terminus of TGE. The region encoding amino acids 218-547 was cloned into the vector pWT211 under control of the tryptophan promoter. The resultant protein produced contains some non-Fc amino acids. These were removed by replacing their coding sequence with a bicistronic linker. The resultant construct encodes the Fc(epsilon) constant heavy region from amino acids 226-547. When it is expressed in E.coli, the protein produced is a non-glycosylated Fc(epsilon) fragment. Altering the pattern of immunogenic and able to induce antibodies that recognise native IgE but do not form histamine-releasing complexes. The Fc fragments can be used in anti-allergenic vaccines to modulate the intensity of immune responses
                                                                                                                                                                                                                          Query Match

The sequence is preferably mutated (see AAR75225) to represent a protein encoding a protein where Cys225 is mutated, optionally together with Val224, Ser226 and Arg227. The protein is useful in the study and treatment of allergy.
                                                                                                                                                                                                                                                  11-MAY-2000

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is an immunogenic peptide consisting of the heavy chain constant regions 2, 3 and 4 of the human IgE. It was used to construct a number of immunogenic peptides which consisted of regions of IgE from different mammals, which appear to cause a stronger polyclonal anti-self IgE response than peptides consisting of the same regions from one mammal. Immunogenic peptides, particularly those consisting of different heavy chain constant regions, can be used for vaccination in humans, against bacterial and viral infections and allergies, such as asthma, fur, pollen and food allergies and eczema.

                                                                                                                                                                                                                                                                                                                                                                                      Ωy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes immunoglobulin E (IgE)-CH3 domain CC antigenic peptides (I). (I) have anti-allergic, anti-anaphylactic CC and anti-asthmatic properties. (I) induces polyclonal antibodies Specific for a target effector site on the ppsilon-heavy chain of IgE, CC and so preventing triggering and activation of mast cells and basophils CC and downregulation of IgE synthesis. Conjugates, or fusion peptides, CC containing (I) are used for active immunisation against IgE-mediated CC allergies, e.g. food allergies, asthma, anaphylaxis, or flea-allergy CC dermatitis. Nucleic acids that encode these compounds are useful for CC recombinant production of corresponding peptides or in DNA vaccines. CC Conjugates of (I) that include a promiscuous T helper cell epitope (functional in genetically diverse subjects), in addition to a B cell CC constraints (disulfide bridge) to stabilise conformational features and CC maximize cross-reactivity to the natural target. They induce safe CC (non-anaphylactogenic) antibodies. AAY79994 to AAY80084 represent amino acid sequences used in the exemplification of the present invention.

Sequence 2, Application US/09949375A
Patent No. US20020172673A1
GENERAL INFORMATION:
APPLICANT: KLYSNER, Steen et al.
TITLE OF INVENTION: METHOD FOR DOWN-REGULATING IG:
FILE REFERENCE: 3631-0111P
CUTRENT APPLICATION NUMBER: US/09/949,375A
CUTRENT FILING DATE: 2002-01-18
NUMBER OF SEQ ID NOS: 38
SOFTWARE: Patentin version 3.1
SEQ ID NO 2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             GENERAL INFORMATION:
